I have used CSv, parsing XML parsing Core Data to implement this app. We are passing all the value of xml file and then separating two key from the <entry> and then <title> and <summary>. We are again using some string functions to replace html tags and make the summary view in proper order.

I have Used to core data and saved csv file value to the core data then we implemented picker view. We are further using NSfetech functionality of core data to retrieve data from the core data and use those value in picker view.
